

Avian Influenza Report

Avian Influenza Report is a weekly report produced by the Respiratory Disease Office, Centre for Health Protection of the Department of Health. This report highlights global avian influenza activity in humans and birds.

VOLUME 13, NUMBER 44

Reporting period: October 29, 2017 – November 4, 2017 (Week 44)

(Published on November 7, 2017)

Summary

1. Since the previous issue of Avian Influenza Report (AIR), there were no new human cases of avian influenza A(H7N9). The latest case was reported on September 15, 2017. Since March 2013 (as of November 4, 2017), there were a total of 1564 human cases of avian influenza A(H7N9) reported globally (including 766 cases reported in the fifth wave from October 1, 2016 to September 30, 2017).
2. Since the previous issue of AIR, there were no new human cases of avian influenza A(H5N6). Since 2014 (as of November 4, 2017), 16 human cases of avian influenza A(H5N6) were reported by the National Health and Family Planning Commission (NHFPC) and all occurred in Mainland China. The latest case was reported on December 1, 2016.
3. Since the previous issue of AIR, there were no new human cases of avian influenza A(H5N1). From 2011 to 2016, 10 to 145 confirmed human cases of avian influenza A(H5N1) were reported to the World Health Organization (WHO) annually (according to onset date). In 2017, there have been so far three cases in Egypt and one case in Indonesia. The latest case was reported on September 27, 2017. *

* Since November 21, 2012, WHO only publishes information on human cases with avian influenza A(H5N1) infection in “[Influenza at human - animal interface: Monthly Risk Assessment Summary](#)”. Only cases of human infection with H5N1 involved in events that are unusual or associated with potential increased risks will be reported in Disease Outbreak News. The latest [report](#) was published in September, 2017.
