

The UK 2013-18 AMR Strategy and Experience in Tackling AMR

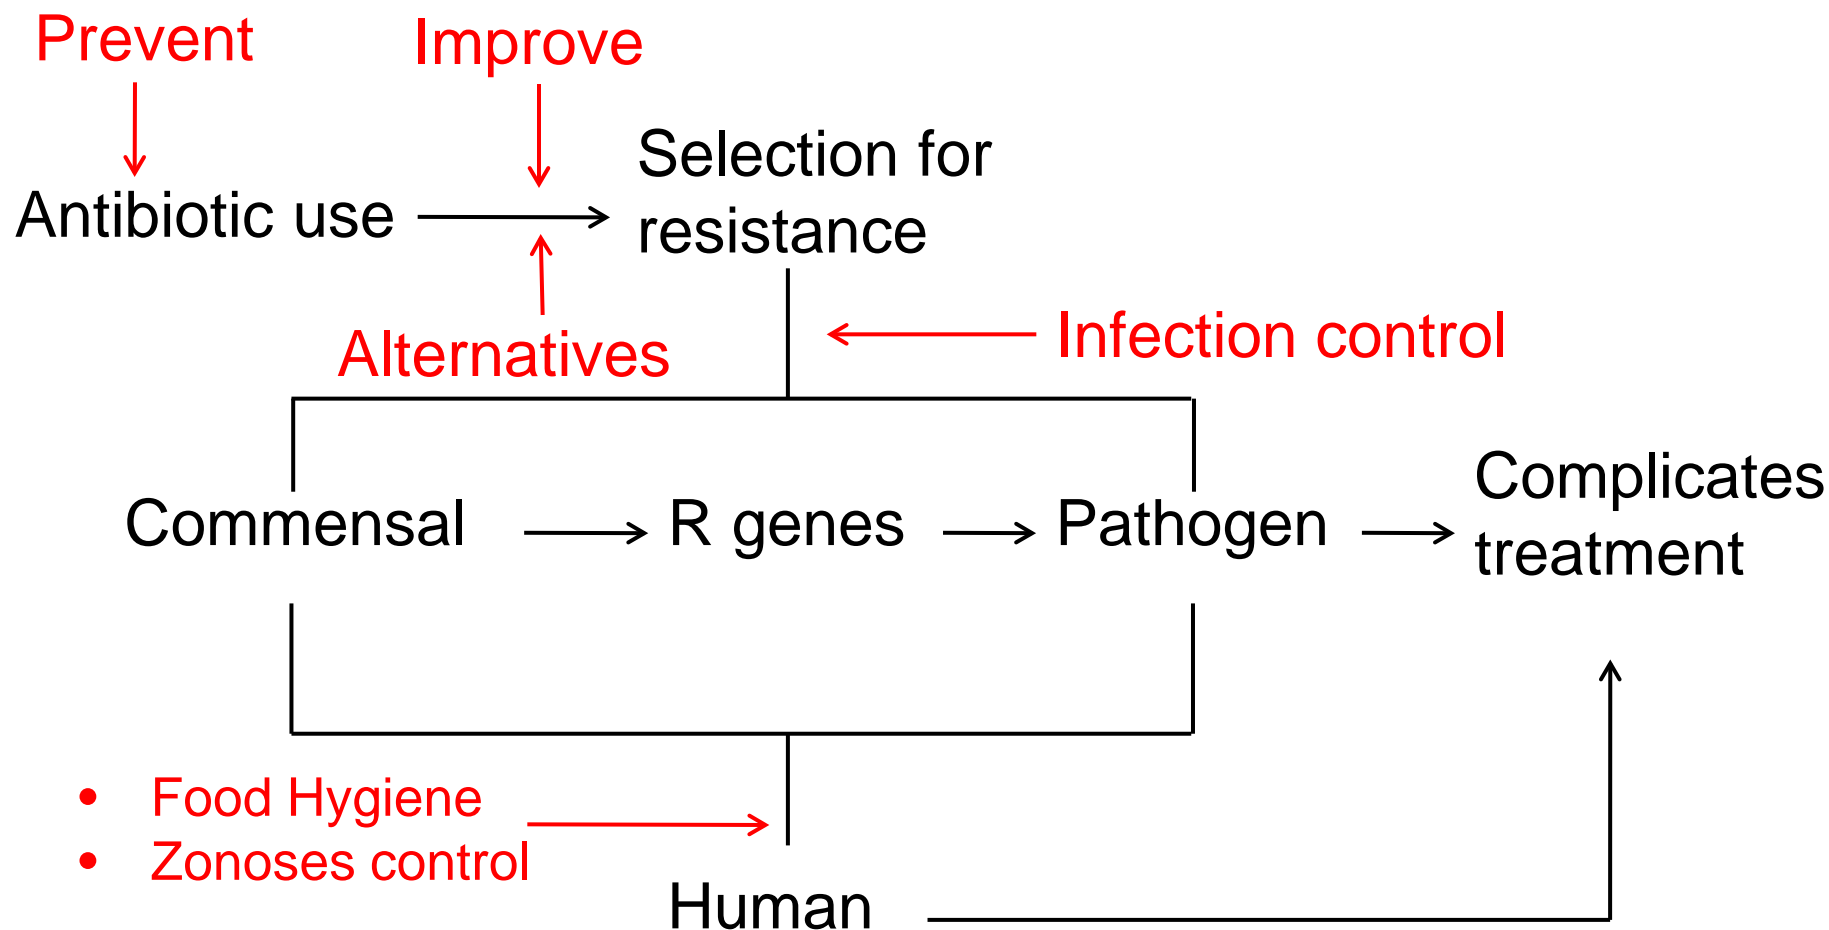

Presented by: Prof. Peter Borriello
Date: November 2018

- Working hypothesis
- Strategy adopted
- Tactics employed
- Animal v Human

The working Hypothesis

The working Hypothesis

UK 5 year AMR strategy:

1. Improving infection prevention and control
2. Optimising prescribing
3. Improving professional education, training, public engagement.
4. Developing new drugs, treatments, diagnostics.
5. Increased access to/use of surveillance data.
6. Identification and prioritisation of AMR research needs.
7. Strengthened international collaboration

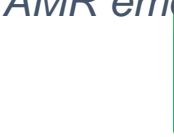

Figure 2. *UK efforts to tackle AMR include global and domestic activities, identifying drivers of AMR emergence and spread*

 **Veterinary
Medicines
Directorate**

GLOBAL ACTIVITIES

- Drive global advocacy, governance and political agenda
- Promote access and responsible use
- Improve detection and surveillance
- Reduce the burden of infection in humans and animals
- Promote R&D

DOMESTIC ACTIVITIES

- Improve IPC practices
- Optimise prescribing practice
- Improve professional education, training and public engagement
- Improve access to, and use of, surveillance data
- Develop new drugs, treatments and diagnostics

Key International Leadership/Advocacy

WHA / WHO: 2014/15

UN: 2016

G7 / G20: 2017

O'Neill Report

Sales Use Resistance

Quantity of antibiotics sold for use in livestock for 30 European countries as reported by ESVAC; mg active substance sold per population correction unit (mg/PCU); 2016

Consumption of antibiotics for systemic use (ATC group J01) in the community and hospital sector in Europe as reported by ESAC-Net; 2016

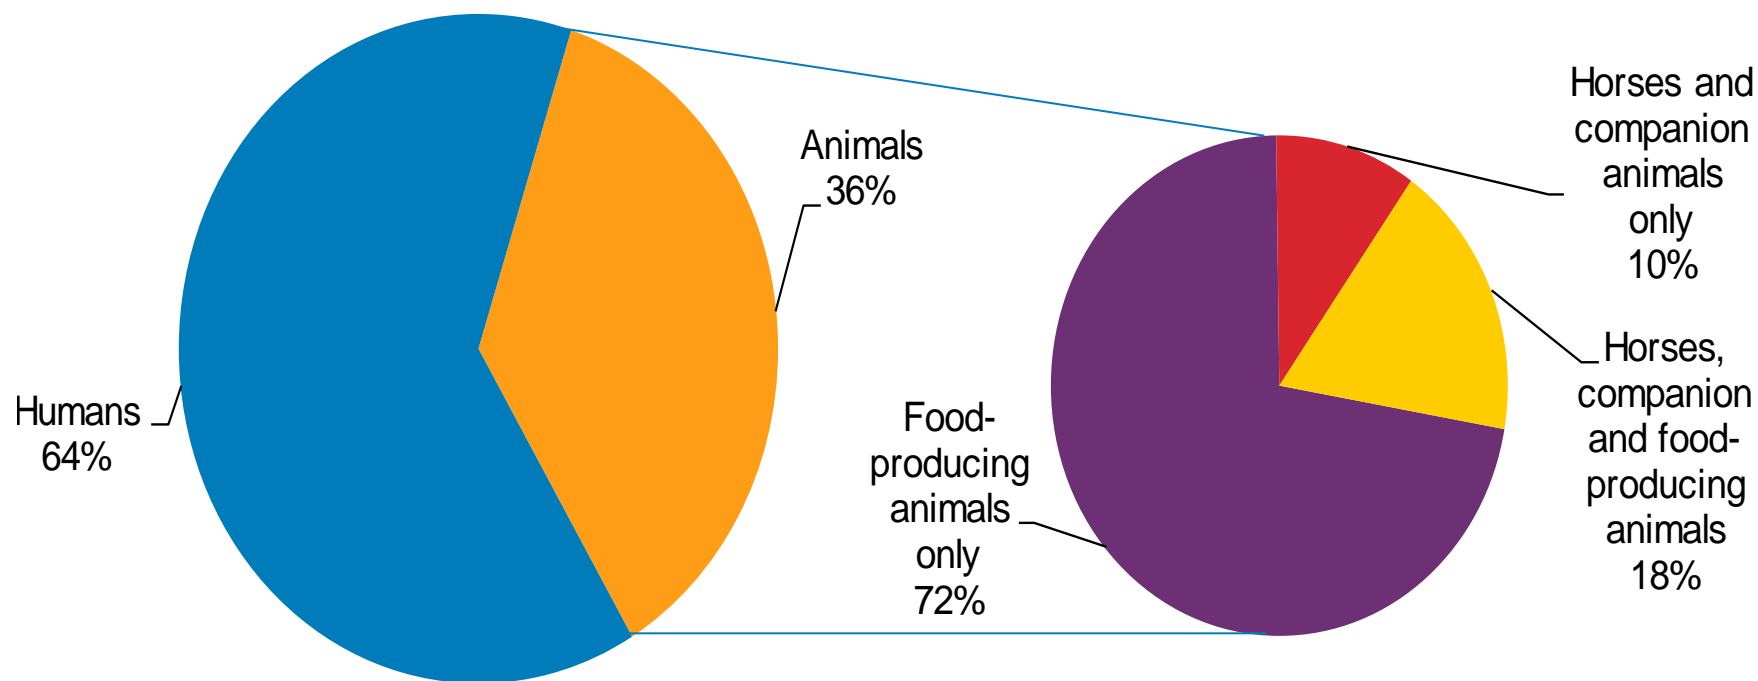

Figure 6. Sales of Antibiotics in UK food-producing animals

Comparison of antibiotics sold for use in people and animals (UK 2017)

Sales of Antibiotics

Active ingredient (% tonnes) of total antibiotics sold for all animal species by antibiotic class, 2017

* Amphenicols, lincomycin, pleuromutilins, polymyxins (excluding colistin) and steroidal antibiotics.

Source: Fig. 1.3; p. 19

[VARSS REPORT 2017](#)

Sales of Antibiotics

Trends of antibiotic sales by highest priority critically important antibiotic for use in food-producing animals and adjusted for animal population (mg/kg), 2013-2017

	2013	2014	2015	2016	2017	Compared with 2016	Compared with 2013
Sales of all antibiotics (mg/kg)	62	62	57	45	37	↓ 18%	↓ 40%
FQ* (mg/kg)	0.36	0.35	0.34	0.23	0.16	↓ 30%	↓ 55%
3/4 gen ceph* (mg/kg)	0.18	0.19	0.17	0.15	0.12	↓ 21%	↓ 32%
Colistin (mg/kg)	0.11	0.12	0.12	0.02	0.001	↓ 94%	↓ 99%

* FQ: fluoroquinolones; 3/4 gen ceph: 3rd and 4th generation cephalosporins

Source: p. 7

People v Animals for tonnes active ingredient of HP-CIAs.

Sales of Antibiotics

Total sales (tonnes) of active ingredient for all animal species
by antibiotic class, 2017

•: 1 tonne

FQ: fluoroquinolones

* Includes 3rd and 4th generation cephalosporins

** Includes amphenicols, lincomycins, pleuromutilins, steroidal antibiotics and polymyxins (including colistin)

Source: p. 7

[VARSS REPORT 2017](#)

Sales of Antibiotics

Combined sales of premix and oral/water antibiotic products (tonnes of active ingredient), ■ tetracyclines, ■ beta-lactams, ■ trimethoprim/ sulphonamides, ■ other*, ■ macrolides, 2013–2017

*Aminoglycosides, fluoroquinolones, amphenicols, lincomycins, pleuromutilins, polymyxins and steroidal antibiotics

Source: Fig. 1.7; p. 23

[VARSS REPORT 2017](#)

Sales of Antibiotics

Sales of injectable antibiotic products (tonnes of active ingredient),

■ tetracyclines, ■ beta-lactams, ■ aminoglycosides, ■ other*,
■ trimethoprim/sulphonamides, 2013–2017

* Macrolides, fluoroquinolones, amphenicols, lincomycins, pleuromutilins, polymyxins and steroidal antibiotics

Figure 4. Antibiotic consumption in the UK (human sector)

Amount of Antibiotics consumed in the UK

Defined Daily Doses per 1000 inhabitants per day

Prescribing settings

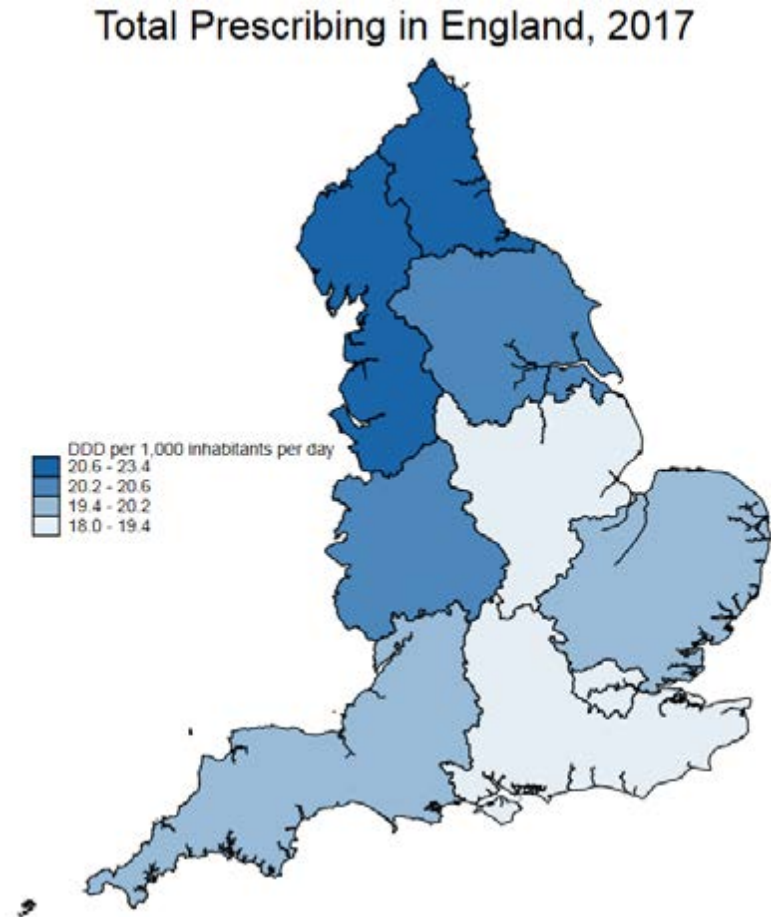

Antibiotic prescribing predominantly occurs in community settings.

Regional Variation in Antibiotic Use

Substantial regional variation in antibiotic use occurs.

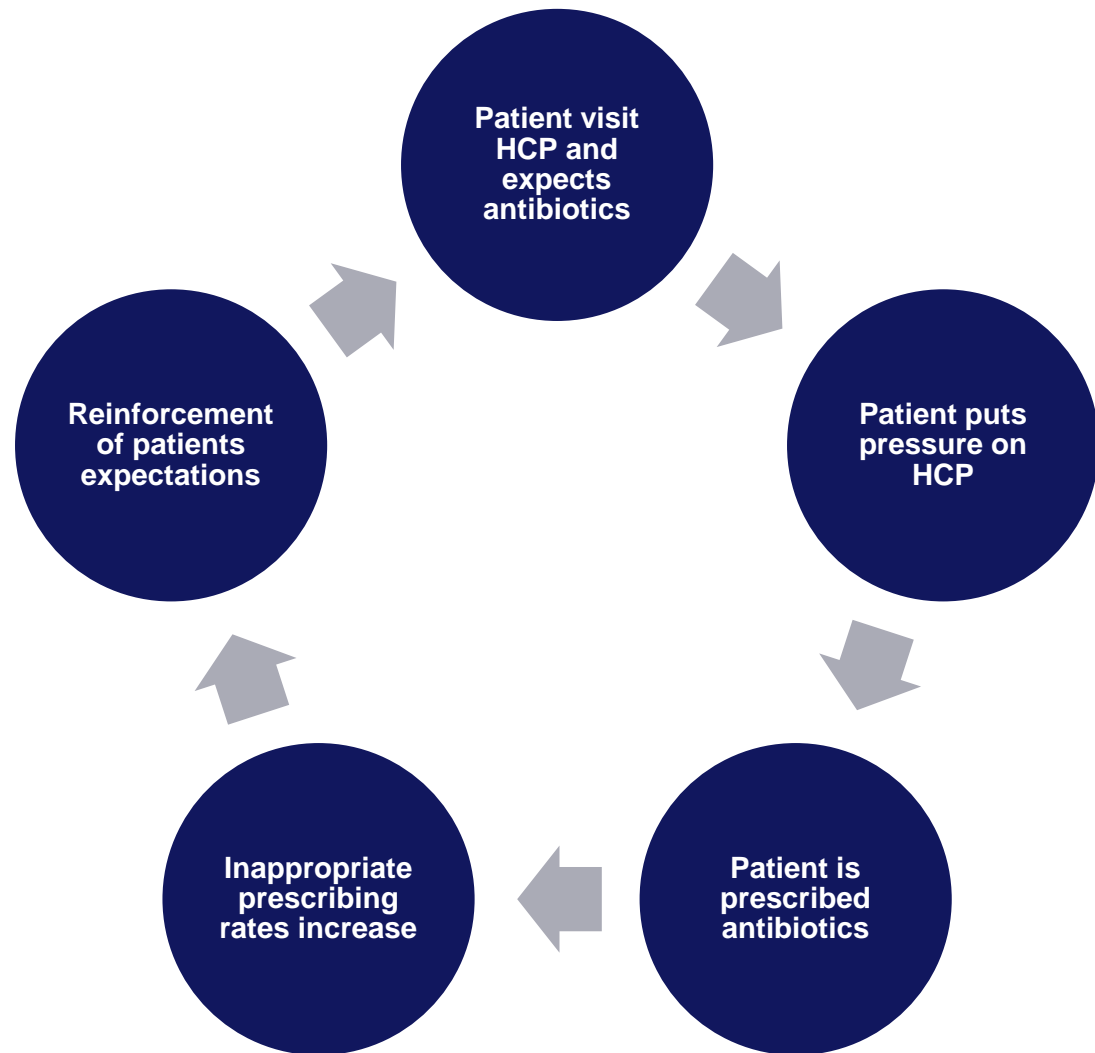

This can be viewed at
CCG, GP and Trust level
at PHE Fingertips AMR
local indicators
<https://fingertips.phe.org.uk/profile/amr-local-indicators>

Reducing inappropriate prescribing is key

20% of antibiotics are prescribed inappropriately

- **Acute cough:**
41% prescribed vs
ideal of 10%
- **Bronchitis:**
82% prescribed vs
ideal of 13%
- **Rhinosinusitis:**
88% prescribed vs
ideal of 11%
- **Sore throat:**
59% prescribed vs
ideal of 13%

Sales Use Resistance

EU Harmonised Monitoring of AMR

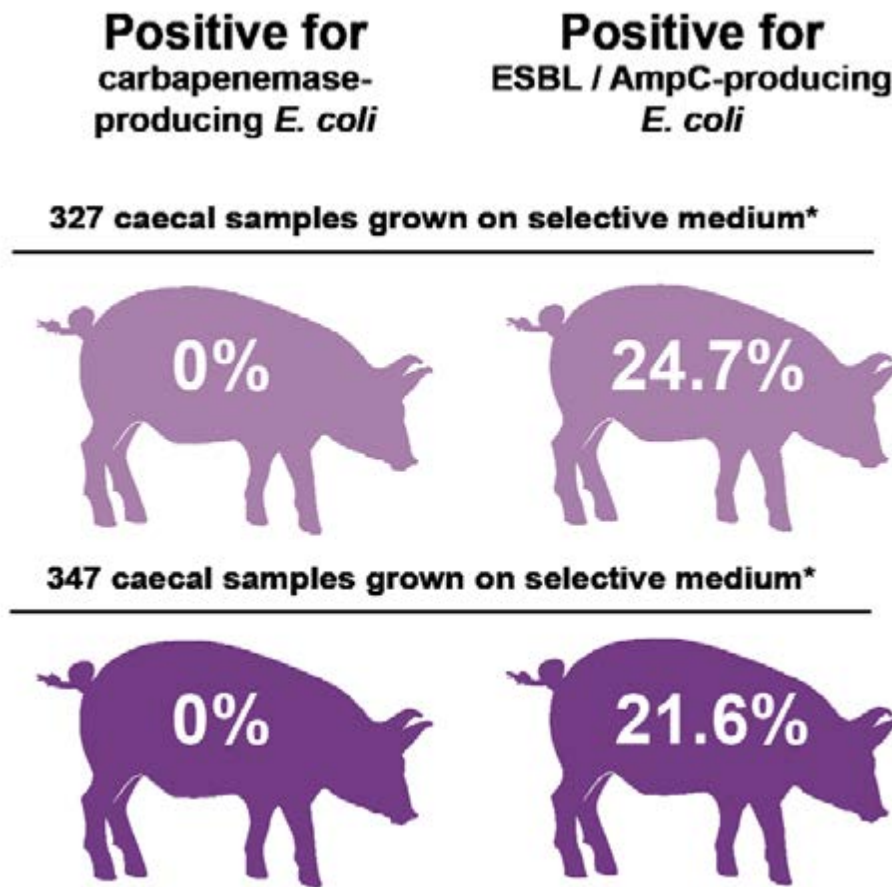

Testing carried out on *E. coli* isolates from pigs collected as part of the EU Harmonised Monitoring Scheme, 2017 and 2015

Source: p. 9

EU Harmonised Monitoring of AMR

Testing carried out on *E. coli* isolates from pigs collected as part of the EU Harmonised Monitoring Scheme, 2017 and 2015

*To note this testing does not identify the type or number of ESBLs present.

Source: p. 9

[VARSS REPORT 2017](#)

EU Harmonised Monitoring of AMR

Percentage resistance (interpreted using EUCAST CBPs) in *E. coli* isolates from healthy pigs at slaughter, 2015 (■; n=150) and 2017 (■; n=186)

*Interpreted using EUCAST ECOFF values as no CBP value is available

Source: Fig. 3.1; p. 48

[VARSS REPORT 2017](#)

Clinical Surveillance of AMR

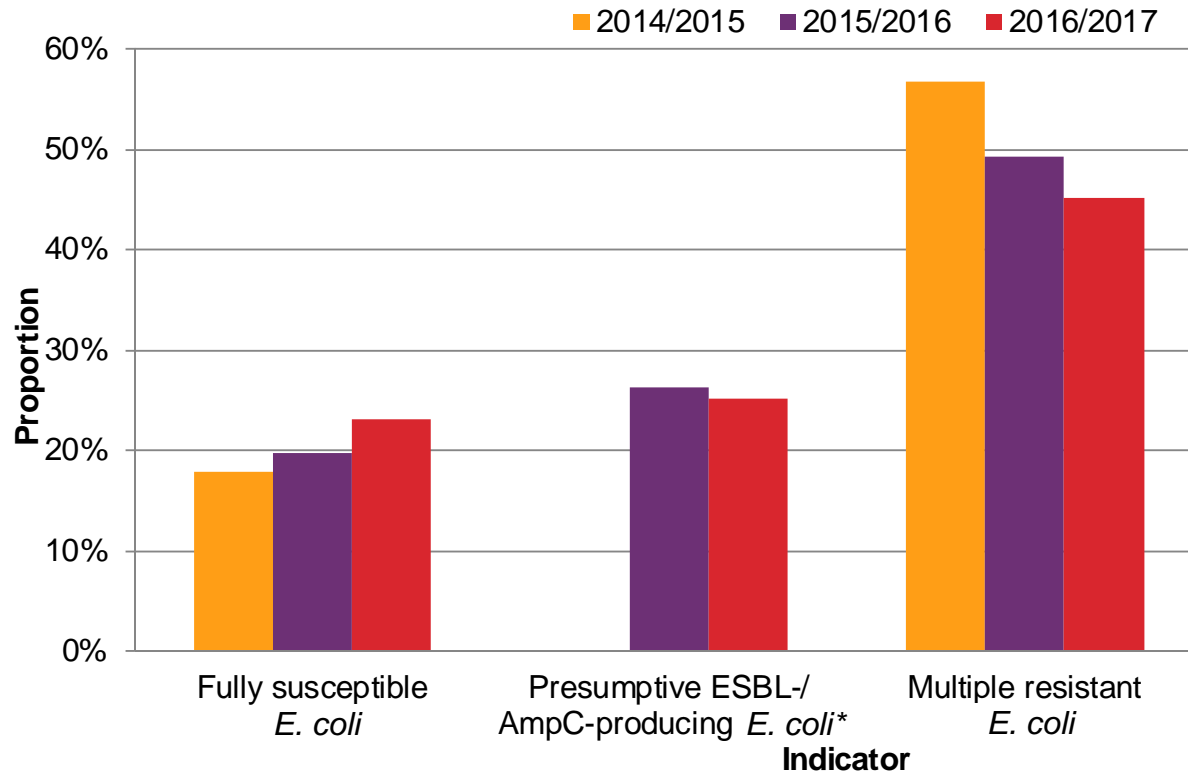

Percentage of resistant *E.coli* isolates from poultry and pigs from clinical surveillance, 2015-2017

Source: p. 10

[VARSS REPORT 2017](#)

Recommended primary (proportion of fully susceptible *E. coli* isolates) and secondary indicators (proportion of presumptive ESBL-/ AmpC-producing *E. coli* isolates, proportion of multi-resistant *E. coli* isolates and proportion of ciprofloxacin-resistant *E. coli* isolates) for the animal AMR monitoring in the UK; 2014–2017

* Data not available for 2014/2015

Overview of AMR in BSI from 2013 to 2017

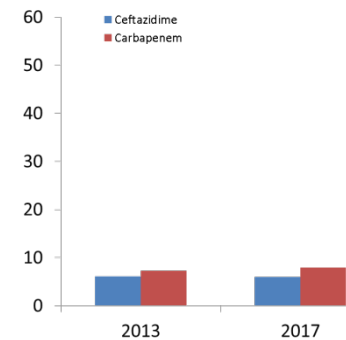

Antibiotic resistance in bacterial bloodstream infections has remained broadly stable over the last 5 years, most likely reflecting the impact of antimicrobial stewardship.

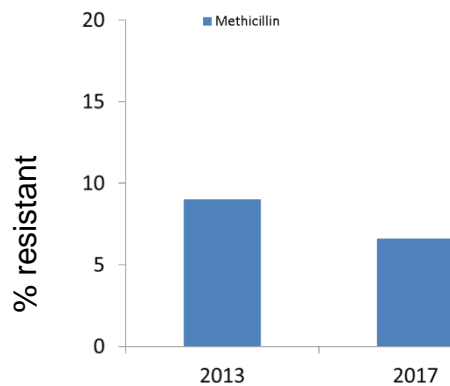

E. coli

K. pneumoniae

Pseudomonas spp.

S. aureus

S. pneumoniae

Enterococcus spp.
