

COVID-19 & FLU EXPRESS

COVID-19 & Flu Express is a weekly report produced by Surveillance Division of the Communicable Disease Branch of the Centre for Health Protection. It monitors and summarises the latest local and global COVID-19 and influenza activities.

Local Situation of COVID-19 Activity (as of Aug 26, 2026)

Reporting period: Aug 16, 2026 – Aug 22, 2026 (Week 34)

- The latest surveillance data showed that the overall local activity of COVID-19 continued to decline.
- The Centre for Health Protection (CHP) has been closely monitoring the local prevalence of SARS-CoV-2 variants. The latest genetic analysis of positive respiratory specimens showed that PQ.16.1.1 is the most prevalent variant in Hong Kong. PQ.16.1.1 is a descendant lineage of NB.1.8.1, which is a descendant of JN.1. The World Health Organization (WHO) listed PQ.16.1.1 as a variant under monitoring (VUM) on Jul 27, 2026. The WHO stated that existing COVID-19 vaccines are expected to be effective against PQ.16.1.1, and there is no evidence to suggest that PQ.16.1.1 will cause more serious diseases.
- Members of the public are advised to maintain strict personal and environmental hygiene at all times for personal protection against COVID-19 infection and prevention of the spread of the disease in the community. High-risk people (e.g. persons with underlying medical conditions or persons who are immunocompromised) should adopt additional measures to protect themselves such as wearing mask properly when going to public places. For other details, please visit the COVID-19 information page (<https://www.chp.gov.hk/en/healthtopics/content/24/102466.html>).
- Members of the public are advised to take note of the latest recommendations on the use of COVID-19 vaccines in Hong Kong to protect themselves from serious outcomes of COVID-19. High-risk priority groups are recommended to receive a dose of COVID-19 vaccine at least six months since the last dose or infection, regardless of the number of doses received previously. For more details, please visit (https://www.chp.gov.hk/files/pdf/consensus_recommendations_on_the_use_of_covid-19_vaccines_in_hong_kong_oct2025.pdf).
- For the latest information on COVID-19 and prevention measures, please visit the thematic website of COVID-19 (<https://www.coronavirus.gov.hk/eng/index.html>).

Laboratory surveillance for COVID-19 cases

Positive nucleic acid test laboratory detections for severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) virus

(Note: The data reported are provisional figures and subject to further revision.)

In week 34, the weekly number of newly recorded positive nucleic acid test laboratory detections for SARS-CoV-2 virus was 159 as compared to 268 in the preceding week. (Figure 1.1)

In the first 4 days of week 35 (Aug 23– Aug 26), the daily number of newly recorded positive nucleic acid test laboratory detections for SARS-CoV-2 virus ranged from 10 to 21.

Since Jan 30, 2023, the cumulative number of positive nucleic acid test laboratory detections was 89,445 (as of Aug 26, 2026).

Figure 1.1 Weekly number of positive nucleic acid test laboratory detections for SARS-CoV-2 virus

Positive detection rate of specimens tested positive for SARS-CoV-2 virus at the Public Health Laboratory Services Branch, Centre for Health Protection

Among the 10,029 respiratory specimens received by the Public Health Laboratory Services Branch (PHLSB) in week 34, 204 (2.03%) were tested positive for SARS-CoV-2 virus as compared to 375 (3.40%) in the preceding week. (Figure 1.2)

Figure 1.2 Percentage of specimens tested positive for SARS-CoV-2 virus at PHLSB

COVID-19 outbreak surveillance

(Note: The data reported are provisional figures and subject to further revision.)

In week 34, 3 COVID-19 outbreaks occurring in schools/institutions were recorded (affecting 12 persons), as compared to 4 outbreaks recorded in the previous week (affecting 15 persons). (Figure 1.3)

In the first 4 days of week 35 (Aug 23–Aug 26), 2 COVID-19 outbreaks occurring in schools/institutions were recorded (affecting 11 persons).

Figure 1.3 COVID-19 outbreaks in schools/institutions

Type of institutions	Week 33	Week 34	First 4 days of week 35 (Aug 23–Aug 26)
Child care centre/ kindergarten (CCC/KG)	2	0	0
Primary school (PS)	0	0	0
Secondary school (SS)	0	0	0
Residential care home for the elderly	2	1	1
Residential care home for persons with disabilities	0	2	1
Others	0	0	0
<i>Total number of outbreaks</i>	4	3	2
<i>Total number of persons affected</i>	15	12	11

Surveillance of severe and fatal COVID-19 cases

(Note: The data reported are provisional figures and subject to further revision.)

In week 34, the weekly number of severe COVID-19 cases including deaths with cause of death preliminarily assessed to be related to COVID-19 was 6 as compared to 12 in the preceding week. (Figure 1.4)

Figure 1.4 Weekly number of severe COVID-19 cases including deaths

Note: Severe and fatal cases are recorded according to their initial reporting dates.

Sewage surveillance of SARS-CoV-2 virus

In week 34, the 7-day geometric mean per capita viral load of SARS-CoV-2 virus from sewage surveillance was around 130,000 copy/L as compared to around 220,000 copy/L in the preceding week. (Figure 1.5)

Figure 1.5 7-day geometric mean per capita viral load of SARS-CoV-2 virus from sewage surveillance since May 1, 2022

Note: The dotted line refers to the temporary sewage sampling suspension for a safety review by the Drainage Services Department.

Acknowledgement

The initiative is funded by the Hong Kong Jockey Club Charities Trust through its "Special Donation on Epidemic Preparedness" to the CHP.

COVID-19 surveillance among sentinel family medicine clinics and sentinel private medical practitioner clinics

In week 34, the average consultation rate for COVID-19 among sentinel family medicine clinics and sentinel private medical practitioner clinics were 7.2 (Figure 1.6) and 4.0 (Figure 1.7) COVID-19 cases per 1,000 consultations, respectively.

Figure 1.6 Average consultation rate of COVID-19 cases in family medicine clinics

Figure 1.7 Average consultation rate of COVID-19 cases in private medical practitioner clinics

Surveillance on SARS-CoV-2 variants

Currently, WHO is monitoring one variant of interest (VOI), which is JN.1, and four VUMs, which are PQ.16.1.1, NB.1.8.1, XFG and BA.3.2. CHP conducts surveillance on SARS-CoV-2 variants from sewage samples. The latest surveillance data (as of Aug 19, 2026) showed that PQ.16 (including PQ.16.1.1) is the most prevalent variant, comprising 77.3% of all characterised specimens. (Figure 1.8)

Figure 1.8 Estimated proportion of variants among sewage samples

*Including the variant's descendant lineages, except those individually specified elsewhere in the table.

#Those SARS-CoV-2 variants not classified as VOIs/VUMs by WHO at the time of reporting.

Note: XFG is the descendant lineage of JN.1. BA.3.2 is a descendent lineage of the Omicron variant BA.3.

CHP also conducted genetic characterisation on positive respiratory specimens between Aug 5 and Aug 18, 2026. The results showed that PQ.16.1.1 was the most prevalent variant, comprising 77% of all characterised specimens from severe and fatal cases and 70% from non-severe cases.

Global situation of COVID-19 activity

- According to the WHO, global SARS-CoV-2 activity were stable, with variations observed across some regions.
- The COVID-19 activity in some of the neighbouring regions increased, while the activity levels at Canada, the UK, Europe, and Australia remained low.
 - ◆ In Chinese Mainland (week ending Aug 16, 2026), the percentage of specimens tested positive for SARS-CoV-2 declined slightly. Overall activity remained at a moderate level. The predominant variant was NB.1.8.1 recently. In Taiwan region (week ending Aug 22, 2026), the COVID-19 activity remains in a plateau phase, with the number of COVID-19 outpatient and emergency visits reaching a peak before declining slightly. The predominant variant was PQ.16.1.1.
 - ◆ In Japan (week ending Aug 16, 2026), the average number of reported COVID-19 cases per sentinel site was 1.12 compared to 1.79 in the preceding week. The predominant variant was BA.3.2.
 - ◆ In South Korea (week ending Aug 15, 2026), the weekly detection rate for SARS-CoV-2 was 9.1% compared to 5.7% in the preceding week. The predominant variant was BA.3.2.
 - ◆ In Singapore (week ending Aug 15, 2026), the positivity rate for COVID-19 among acute respiratory infection (ARI) samples in the community was 2% compared to 7% in the preceding week.
 - ◆ In the United States (week ending Aug 15, 2026), the percent positivity of COVID-19 was 4.8% compared to 3.8% in the preceding week. The predominant variant was XFG.
 - ◆ In Canada (week ending Jul 25, 2026), indicators of COVID-19 activity remained at low level. The percentage of tests positive for COVID-19 was 1.0%, compared to 1.0% in the preceding week. The predominant variant was NB.1.8.1.
 - ◆ In the United Kingdom (week ending Aug 9, 2026), COVID-19 activity remained at low level. COVID-19 PCR positivity in hospital settings was 2.2% compared to 1.6% in the preceding week. The predominant variant was XFG.
 - ◆ In Europe (week ending Aug 16, 2026), SARS-CoV-2 positivity from sentinel specimens was at 3.8% compared to 5.2% at the previous week. The predominant variant was XFG.
 - ◆ In Australia (fortnight ending Aug 9, 2026), test positivity for SARS-CoV-2 remained stable. The predominant variant was NB.1.8.1.

Local Situation of Influenza Activity (as of Aug 26, 2026)

Reporting period: Aug 16 – 22, 2026 (Week 34)

- Hong Kong is in influenza season. The latest surveillance data showed that the overall influenza activity remained at a high level.
- Influenza can cause serious illnesses in high-risk individuals and even healthy persons. Given that seasonal influenza vaccines are safe and effective, all persons aged 6 months or above except those with known contraindications are recommended to receive influenza vaccine to protect themselves against seasonal influenza and its complications, as well as related hospitalisations and deaths.
- The Government is actively making preparations for the 2026/27 Seasonal Influenza Vaccination (SIV) Programmes. Details of the arrangements, such as eligible groups and vaccination venues, will be announced in due course.
- Apart from getting influenza vaccination, members of the public should always maintain good personal and environmental hygiene.
- For the latest information on seasonal influenza and its prevention, please visit the Centre for Health Protection's Seasonal Influenza page (http://www.chp.gov.hk/en/view_content/14843.html).

Influenza-like-illness surveillance among sentinel family medicine clinics and sentinel private medical practitioner clinics, 2022-26

In week 34, the average consultation rate for influenza-like illness (ILI) among sentinel family medicine clinics (FMC) was 14.4 ILI cases per 1,000 consultations, which was lower than 16.0 recorded in the previous week (Figure 2.1, left). The average consultation rate for ILI among sentinel private medical practitioner (PMP) clinics was 40.9 ILI cases per 1,000 consultations, which was lower than 46.9 recorded in the previous week (Figure 2.1, right).

Figure 2.1 ILI consultation rates at sentinel FMC (left) and PMP clinics (right), 2022-26

Laboratory surveillance, 2022-26

Among the 10,463 respiratory specimens* received in week 34, 1,077 (10.29%) were tested positive for seasonal influenza A or B viruses. Among the subtyped influenza detections, there were 735 (70%) influenza A(H1), 245 (24%) influenza A(H3) and 65 (6%) influenza B viruses. The positive percentage (10.29%) was above the baseline threshold of 4.94% but was lower than 10.33% recorded in the previous week (Figure 2.2).

Figure 2.2 Percentage of respiratory specimens tested positive for influenza viruses, 2022-26 (upper: overall positive percentage, lower: positive percentage by subtypes)

[Notes: The Centre for Health Protection (CHP) of the Department of Health closely monitors the local seasonal influenza activity through a series of surveillance systems. Among them, the CHP sets threshold levels for two important influenza indicators, including the positive percentage of influenza detections among respiratory specimens and the admission rate of patients diagnosed with influenza in public hospitals. These threshold levels are calculated statistically based on data collected for both indicators in the past years during non-season periods. Using these thresholds, the CHP assesses the current local situation of seasonal influenza with higher accuracy and determines whether Hong Kong enters influenza season. The CHP annually reviews and analyses the latest surveillance data, and updates these threshold levels where appropriate. The sensitivity of the surveillance system is enhanced with the updated thresholds of positive percentage of influenza detection and admission rate of higher coherence.]

Remarks: Some specimens may contain vaccine strains from people with recent history of receiving live-attenuated influenza vaccine

* Including 10,029 specimens received by Public Health Laboratory Services Branch, Centre for Health Protection and 434 specimens received by the Hospital Authority

Surveillance of antiviral susceptibility of influenza A and B viruses

- The Public Health Laboratory Services Branch of the Centre for Health Protection tests virus isolates of influenza viruses obtained from cell culture for reduced antiviral susceptibility. For influenza A(H1) viruses, genotypic assay for H275Y substitution (which confers resistance to oseltamivir) is also performed on selected clinical specimens.
- In June 2026, there were no new reports of influenza viruses with reduced susceptibility to oseltamivir and baloxavir. There were also no reports of influenza A(H1) virus with H275Y substitution.
- For the results of previous months, please refer to the following webpage: <https://www.chp.gov.hk/en/statistics/data/10/641/695/7124.html>
- The detection rates of oseltamivir-resistant influenza A and B viruses remain low (less than 5%) according to latest surveillance data of overseas countries.

Influenza-like illness outbreak surveillance, 2022-26

In week 34, 18 ILI outbreaks occurring in schools/institutions were recorded (affecting 102 persons), as compared to 23 outbreaks recorded in the previous week (affecting 137 persons) (Figure 2.3). The overall number was currently at the low intensity level (Figure 2.4*). In the first 4 days of week 35 (Aug 23 to 26), 19 ILI outbreaks in schools/institutions were recorded (affecting 142 persons). Since the start of the influenza season in week 26, 237 outbreaks were recorded (as of August 26).

Figure 2.3 ILI outbreaks in schools/institutions, 2022-26

Type of institutions	Week 33	Week 34	Cumulative number of outbreaks during influenza season
Child care centre/ kindergarten (CCC/KG)	6	0	34
Primary school (PS)	1	4	63
Secondary school (SS)	0	0	9
Residential care home for the elderly	9	10	83
Residential care home for persons with	6	3	23
Others	1	1	25
<i>Total number of outbreaks</i>	23	18	237
<i>Total number of persons affected</i>	137	102	1656

In comparison, 145 to 816 outbreaks were recorded in the same duration of surveillance (9 complete weeks) in the 2023 to 2025 seasons, as compared with 218 outbreaks in the current season (Figure 2.5).

Figure 2.4 ILI outbreaks in schools/institutions, 2025-26

Figure 2.5 Cumulative numbers of ILI outbreaks reported during major influenza seasons, 2023–26

Note: The predominating virus was shown in bracket.

* Various intensity levels applicable for this year were calculated with the moving epidemic method (MEM). For details, please refer to this webpage: https://www.chp.gov.hk/files/pdf/explanatory_note_for_flux_mem_eng.pdf

Influenza-associated hospital admission rates in public hospitals based on discharge coding, 2022-26

In week 34, the overall admission rate in public hospitals with principal diagnosis of influenza was 0.59 (per 10,000 population) as compared to 0.64 recorded in the previous week (Figure 2.6). It was above the baseline threshold of 0.27 but was at the low intensity level (Figure 2.7*). The influenza-associated admission rates for persons aged 0-5 years, 6-11 years, 12-17 years, 18-49 years, 50-64 years and 65 years or above were 2.58, 0.90, 0.18, 0.15, 0.23 and 1.48 cases (per 10,000 people in the age group) respectively, as compared to 3.12, 1.25, 0.47, 0.13, 0.26 and 1.52 cases in the previous week (Figure 2.6).

Figure 2.6 Influenza-associated hospital admission rates, 2022-26 (upper: overall rate, lower: rates by age groups)

[Notes: The Centre for Health Protection (CHP) of the Department of Health closely monitors the local seasonal influenza activity through a series of surveillance systems. Among them, the CHP sets threshold levels for two important influenza indicators, including the positive percentage of influenza detections among respiratory specimens and the admission rate of patients diagnosed with influenza in public hospitals. These threshold levels are calculated statistically based on data collected for both indicators in the past years during non-season periods. Using these thresholds, the CHP assesses the current local situation of seasonal influenza with higher accuracy and determines whether Hong Kong enters influenza season. The CHP annually reviews and analyses the latest surveillance data, and updates these threshold levels where appropriate. The sensitivity of the surveillance system is enhanced with the updated thresholds of positive percentage of influenza detection and admission rate of higher coherence.]

Rate of ILI syndrome group in accident and emergency departments, 2022-26[#]

In week 34, the rate of the ILI syndrome group in the accident and emergency departments (AEDs) was 137.5 (per 1,000 coded cases), which was lower than the rate of 149.0 in the previous week (Figure 2.8).

#Note: This syndrome group includes codes related to ILI such as influenza, upper respiratory tract infection, fever, cough, throat pain, and pneumonia.

Figure 2.8 Rate of ILI syndrome group in AEDs, 2022-26

Fever surveillance at sentinel child care centres/ kindergartens, 2022-26

The surveillance for week 34 was suspended due to summer holiday. In week 33, 0.46% of children in the sentinel child care centres / kindergartens (CCCs/KGs) had fever (38°C or above) (Figure 2.9).

Figure 2.9 Percentage of children with fever at sentinel CCCs/KGs, 2022-26

Fever surveillance at sentinel residential care homes for the elderly, 2022-26

In week 34, 0.14% of residents in the sentinel residential care homes for the elderly (RCHes) had fever (38°C or above), compared to 0.14% recorded in the previous week (Figure 2.10).

Figure 2.10 Percentage of residents with fever at sentinel RCHes, 2022-26

Influenza-like illness surveillance among sentinel Chinese medicine practitioners, 2022-26

In week 34, the average consultation rate for ILI among Chinese medicine practitioners (CMPs) was 0.97 ILI cases per 1,000 consultations as compared to 1.44 recorded in the previous week (Figure 2.11).

Figure 2.11 ILI consultation rate at sentinel CMPs, 2022-26

Surveillance of severe influenza cases

(Note: The data reported are provisional figures and subject to further revision.)

Surveillance for intensive care unit (ICU) admission/death with laboratory confirmation of influenza among adult patients (Aged 18 years or above)

Since 2018, the Centre for Health Protection (CHP) has collaborated with the Hospital Authority and private hospitals to monitor ICU admissions and deaths with laboratory confirmation of influenza among adult patients regularly. For surveillance purposes, the cases refer to laboratory-confirmed influenza patients who required ICU admission or died within the same admission of influenza infection. Their causes of ICU admission or death may be due to other acute medical conditions or underlying diseases.

- In week 34, 53 adult cases of ICU admission/death with laboratory confirmation of influenza (including 38 deaths) were recorded, as compared to 70 cases (including 47 deaths) in the previous week. Among the 53 adult cases, 30 were not known to have received the SIV. In the first 4 days of week 35 (Aug 23 to 26), 40 cases were recorded, in which 23 of them were fatal.

Week	Influenza type					
	A(H1)	A(H3)	A (pending subtype)	B	A and B	C
Week 34	30	18	4	1	0	0
First 4 days of week 35 (Aug 23 to 26)	27	8	3	2	0	0

- During the influenza season, 415 adult cases of ICU admission/death with laboratory confirmation of influenza were recorded, in which 263 of them were fatal (as of Aug 26). Among them, 188 patients had influenza A(H1) infection, 172 patients with influenza A(H3), 28 patients with influenza B and 27 patients with influenza A (subtype pending).
- In comparison, 271 to 447 adult cases were recorded in the same duration of surveillance (9 complete weeks) in the 2023 to 2025 seasons, as compared with 375 cases in the current season (Figure 2.12, left). The corresponding figures for deaths were 177 to 297 in the above seasons, as compared with 240 deaths in the current season (Figure 2.12, right).

Figure 2.12 Cumulative numbers of adult severe influenza cases reported during major influenza seasons, 2023–26 (left: ICU admission/death cases; right: deaths)

Note: The predominating virus was shown in bracket.

Surveillance of severe paediatric influenza-associated complication/death (Aged below 18 years)

- In week 34 and the first 4 days of week 35 (Aug 23 to 26), there were 2 cases of severe paediatric influenza-associated complication/death.

Reporting week	Age	Sex	Complication	Fatal case?	Influenza subtype	History of receiving 2025/26 influenza vaccine
34	16 years	Female	Severe pneumonia and septic shock	No	Influenza A(H3)	Yes
34	11 years	Male	Severe pneumonia and myocarditis	No	Influenza A(H3)	Yes

- During the influenza season, 11 paediatric cases of influenza-associated complication/death were reported, in which one of them was fatal. Six cases had infections with influenza A(H3) and five with influenza A(H1). Four cases had not received SIV. In 2026, 19 paediatric cases of influenza-associated complication/death were reported, in which one of them was fatal (as of Aug 26).
- In comparison, 9 to 16 paediatric cases of influenza-associated complication/death were recorded in the same duration of surveillance (9 complete weeks) in the 2023 to 2025 seasons, as compared with 11 cases in the current season (Figure 2.13, left). The corresponding figures for deaths were 0 to 2 in the above seasons, as compared with 1 death in current season (Figure 2.13, right).

Figure 2.13 Cumulative numbers of cases of paediatric influenza-associated complication/death reported during major influenza seasons, 2023–26 (left: complication/death cases; right: deaths)

Note: The predominating virus was shown in bracket.

Severe influenza cases of all ages

- During the influenza season, 426 severe influenza cases among all ages have been reported, including 264 deaths (as of Aug 26).

Age group	Cumulative number of cases (death)
0-5	5 (0)
6-11	4 (1)
12-17	2 (0)
18-49	25 (4)
50-64	49 (16)
>=65	341 (243)

- Among the adult fatal cases with available clinical information, about 89% had chronic diseases.
- Among patients with laboratory confirmation of influenza admitted to public hospitals in this season, 2.7% of admitted cases died during the same episode of admission. It was within the historical range of 2.5% to 4.5%.

Figure 2.14 Weekly number of severe influenza cases by age groups, 2022-26 (the percentage positive for influenza viruses in Figure 2.2 is also shown in this graph)

Sewage surveillance for seasonal influenza

CHP has leveraged established infrastructure to launch a new sewage-based surveillance indicator for tracking local seasonal influenza activity in the community as a complement to the conventional systems. Starting from late October 2025, CHP publishes sewage surveillance results on seasonal influenza viruses.

In week 34, viral load of influenza A and B viruses from sewage surveillance was 3.88 copies (unit adjusted for population)*, which was higher than 3.26 copies* recorded in the previous week (Figure 2.15).

Figure 2.15 Viral load of influenza A and B viruses from sewage surveillance, 2026

**Note: The unit for influenza viral load in sewage is the number of influenza virus copies per 1,000 copies of Pepper Mild Molt Virus (PMMoV), which is a standardised unit. PMMoV is a plant virus primarily found in peppers and their products. It is harmless to humans and does not cause disease. It enters the human body through food ingestion and is excreted in faeces, making it a common biomarker for estimating the size of the population catchment of the sampling sites. Normalising viral load data with PMMoV can reduce the influence of population fluctuations, thereby making the monitoring more accurate and reliable.*

Acknowledgement

The initiative is funded by the Hong Kong Jockey Club Charities Trust through its "Special Donation on Epidemic Preparedness" to the CHP.

Global Situation of Influenza Activity

Globally, influenza detections remained low in week 33, 2026. Influenza A and B viruses were detected in similar proportions (data up to Aug 16, 2026).

- In the United States (week ending Aug 15, 2026), seasonal influenza activity is low. The percentage of specimens tested positive for influenza was below 1%.
- In Europe (week ending Aug 16, 2026), influenza activity was at inter-seasonal level.
- In Chinese Mainland (week ending Aug 16, 2026), the percentage of specimens that tested positive for influenza in the southern provinces slightly increased, while that in the northern provinces remained low, with the rates at 18.6% and 2.1% in week 33, respectively. The proportion of influenza A(H3N2) among detections increased nationwide. In Macao (week ending Aug 15, 2026), the influenza positivity rate was 20.9%, which was higher than the alert level. Influenza A (H3) was predominating.
- In Australia (fortnight ending Aug 9, 2026), the number of influenza cases increased substantially in the last fortnight and current surveillance data suggest that the national influenza peak in 2026 is yet to occur. Majority of the influenza notifications were influenza A.
- In New Zealand (week ending Aug 23, 2026), the national ILI rate increased to 38.29 per 100,000 population, higher than the rate reported to this time in 2022–2025. Influenza-associated hospitalization rate slightly increased. The rate is at the very high activity level for two consecutive weeks, and is similar to the peak seen in the 2022 season. Among sentinel influenza-positive samples, influenza A(H3) was the most frequently detected subtype (68%), followed by A(H1) (21%).
