

# For the Elderly 2

**Vaccination for young people only may not be sufficient to provide protection to the elderly. The best way to protect the elders is to have them get vaccinated themselves.**

**Elders may decide for themselves whether to receive the vaccine or not and let their families know their decisions.**

Co-infection of COVID-19 and seasonal flu possibly leads to more severe condition. Elderly should receive COVID-19 vaccine as soon as possible, well before the arrival of the winter influenza season.

COVID-19 vaccine and flu vaccine can be coadministered in the same occasion.

Even if the elders often stay at home, they may still get infected when they contact infected persons or contaminated objects.

The combination of vaccination and other measures (including mask wearing, hand hygiene and social distancing) allows for maximum protection against the virus.
